## **Question 3** (4 points) Consider the function f(x, y) defined by

$$f(x,y) = \begin{cases} \frac{2xy}{x^2 + y^2} & (x,y) \neq (0,0) \\ 1 & (x,y) = (0,0). \end{cases}$$

Is f continuous at (0,0)? Choose the best answer.

f(x, y) is continuous at (0, 0).

f(x, y) is **not** continuous at (0, 0).

Select the reason which best supports your claim.

- The limit  $\lim_{(x,y)\to(0,0)} \frac{2xy}{x^2+y^2} = 1$ , which can be seen for example by checking on the line y = x.
- The limit  $\lim_{(x,y)\to(0,0)} \frac{2xy}{x^2+y^2} = 1$ , which can be seen by converting to polar coordinates.
- The limit  $\lim_{(x,y)\to(0,0)} \frac{2xy}{x^2+y^2}$  does not exist because the limits along the lines x=0 and y=0 are different.
- The limit  $\lim_{(x,y)\to(0,0)} \frac{2xy}{x^2+y^2}$  does not exist because the limits along the curves  $y=x^2$  and y=0 are different.
- The limit  $\lim_{(x,y)\to(0,0)} \frac{2xy}{x^2+y^2}$  does not exist because the limits along the lines y=x and y=0 are different.

**Question 5** (4 points) The function f(x, y) describes the temperature (°C) in a given region R in the plane, so that f(x, y) is the temperature at position (x, y). A few values of f together with its rates of change are given in the following table. Assuming that f is differentiable, use this data and linear approximation to estimate the temperature at (1.2, 2.4).

(x,y)	f(x,y)	$f_x(x,y)$	$f_y(x,y)$	$f_{xx}(x,y)$	$f_{yy}(x,y)$	$f_{xy}(x,y)$
(1, 2)	(-3)	4	1	4	9	11
(0.2, 0.4)	-7	-3	-6	1	-2	-4

$$f(1.2,24) \approx f(1,2) + f_{x}(1.2) (1.2-1) + f_{y}(1.2) (2.4-2)$$

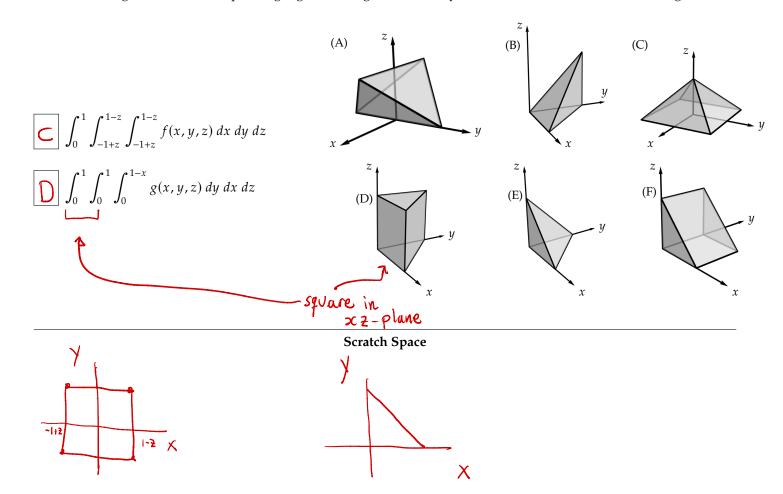

$$= -3 + (4) (0.2) + (1) (0.4)$$

$$= -3 + 0.8 + 0.4 = -1.8$$

$$f(1.2,2.4) \approx \boxed{- | .8}$$
